

Reboot Your Brain with IASIS Micro Current Neurofeedback

***Have you tried everything
but still feel stuck, unable to function
and don't know where to turn next?***

Trinity Counseling has something that may help.

We are delighted to provide an innovative technology, the IASIS Micro Current Neurofeedback system. This system has been shown, in clinical uses, to bring about significant improvements in physical and emotional rehabilitation in a relatively brief process of therapy.

Science and Technology

IASIS MCN is not a medical treatment, but rather a retraining of the brain and nervous system.

Various studies of the brain have shown people who tend to suffer from anxiety, post-traumatic stress, depression, and other conditions have shown high levels of abnormal delta wave activity.

The IASIS Micro Current Neurofeedback system has been proven to reduce or eliminate high levels of abnormal delta wave activity. Brain scans done before and after treatment sessions with IASIS MCN technology have provided some astounding results.

What Can I Expect?

Your clinician has selected you as a client who could benefit from **Micro Current Neurofeedback**. The procedure is painless. The initial session may take 45-60 minutes in total. Follow-up sessions may take 25-30 minutes. Each session involves attaching several small electrode wires to various places on your scalp and then providing extremely small amounts of energy to the brain. If you think of your brain as a computer, the micro currents of electricity help to “re-boot” the brain.

Benefits

The IASIS MCN system has been shown in clinical uses to bring about significant improvements in physical and emotional rehabilitation in a relatively brief process of therapy. For example, clients have experienced a return of clarity, energy, improved sleep, improved sense of humor, motivation in getting things done, as well as an ease in getting them done. Others have experienced improvement in memory and in ability to read and listen. Many also experience an improvement in depression, anxiety, irritability, impatience, and even explosiveness. People who have had a closed head injury, TBI or psychological trauma, have experienced significant improvement in ability to function.

While the long-term effects of using electrical field feedback are unknown, no instances of problems with the emissions from the feedback have ever been recorded. As a reference point for MCN, a cellular telephone generates a signal at least 10 million times the power of the IASIS MCN signal. The intensity of MCN is less than a trillionth of a watt and is only for a few seconds during each procedure. A background signal approximately a thousand times less than the feedback signal is also present as soon as the EEG begins to read the brain waves.

Success Stories

"Depression and anxiety have been a constant in my life. I have been diagnosed with both for many years. After seeking many treatment options I had become sedentary and numb. I had accepted living in a depressed and anxious state. Within my first treatment I experienced a calming effect. In the coming days I noticed that colors were more vivid. As more time has passed, I have felt as if a veil of depression is lifting and I can experience a calmer life. I am hopeful and look forward to further progress."

"Sleep/anxiety was my issue. The night after my first appointment I slept better than I have in years. I definitely feel calmer. This has been wonderful suddenly [I realized] I'm sleeping, feeling better and not climbing the walls. I would definitely recommend it."

"I'm a chronic migraine sufferer. I couldn't get any relief. On the first MCN session my migraine was gone. I could see light. Since I have been coming [for these sessions], my migraines have been very few and far between. I would highly recommend MCN. It's been a lifesaver and brought me back to the person I used to be."

What is IASIS MCN?

IASIS Micro Current Neurofeedback supports the brain waves as they function at rest to become calmer, and at work, more flexible. This involves measuring and recording electrical signals from the scalp and using the frequencies of those signals to guide the speed of a feedback signal. The extremely weak electromagnetic pulses come from the EEG cables. The recorded EEG signals influence the electromagnetic feedback in your brain and this feedback, in turn, changes the quality and frequency of the recorded brainwave signals.

While the results of the use of MCN are quite successful, there can be no guarantee of success. However, experience shows that more than 85% of clients observe noticeable positive changes in their symptoms.
